Material Product Data Sheet
Copper Nickel and Copper Nickel Indium Thermal Spray Powders

Thermal Spray Powder Products:
Metco 57NS, Metco 58NS, Amdry 500C, Amdry 500F

1 Introduction
Copper-based Metco™ 57NS, Metco 58NS, Amdry™ 500C and Amdry 500F are inert gas atomized, alloyed powders developed to protect metal-to-metal wear of titanium alloy parts. Coatings made from these materials are dense, low in oxide content and reduce wear by fretting, adhesion, galling and cavitation.

These materials have a strong history in the aerospace industries, with Metco 58NS being the industry standard for anti-fretting wear applications approved by many major turbine engine OEMs.

These products usually are applied using atmospheric plasma spray (APS) or by combustion powder Thermospray™ with typical coating thicknesses as thin as 0.013 mm – 0.051 mm (0.0005 – 0.002 in). Because of the complexity of part configurations, the coating is used in the as-sprayed condition for most applications.

Metco 58NS, Amdry 500C and Amdry 500F contain indium, which improves the anti-galling and lubricity characteristics of the coating.

Near surface wear properties can be improved with the addition of a dry film lubricant applied to the coating surface after spraying.

1.1 Typical Use and Applications
Applied as a thermal sprayed coating to:
- Turbine engine blade roots or disks slots to resist fretting and galling wear
- Expansion joints or compressor air seals

Upper particle size analysis using sieve in accordance with ASTM B214; lower size analysis using laser diffraction (Microtrac).

2.2 Key Selection Criteria

- Choose the product that meets the required customer material specification.
- Metco 57NS has a slightly higher melting temperature than the copper nickel indium products.
- The copper nickel indium materials exhibit higher coating bond strength and slightly better machinability. The addition of indium improves the anti-galling, lubricity and bearing characteristics of the coatings.
- Amdry 500F has the finest particle size distribution, which can produce coatings that are slightly harder and denser than the other materials and is generally used for applications where thinner coatings are needed. The maximum coating thickness for Amdry 500F is significantly less than Metco 57NS, Metco 58NS and Amdry 500C.
- Plasma sprayed coatings of these materials produce higher hardness with somewhat higher oxide content compared to coatings applied using combustion powder Thermospray™.
- Metco 57NS and Metco 58NS coatings applied using combustion powder Thermospray™ show higher deposition rates than atmospheric plasma sprayed coatings.
- Metco 57NS and Metco 58NS have been sprayed using the TriplexPro™-200 plasma spray gun for improved coating throughput.

2.3 Related Products

- Coatings of Amdry 958 (cobalt alloy with hexagonal boron nitride) have demonstrated better performance than copper nickel indium or copper nickel coatings in several gas turbine applications.
- Amdry 958 coatings contain solid lubricant in various amounts depending on the thermal spray application process (atmospheric plasma spray or HVOF).
- Amdry 958 coatings exhibit better compressive strength than copper-based anti-fretting coatings, making Amdry 958 more suitable for high compressive stress applications such as gas turbine fan blade roots when plastic deformation of the copper-based coatings is an issue.
- It is recommended that new turbine engine applications compare HVOF and APS applied coatings of Amdry 958 to copper-based coatings.
- More information on Amdry 958 is available in the appropriate product data sheet (DSMTS-0018) and Solutions Flash SF-0003).

4.2 Handling Recommendations
- Store in the original container in a dry location.
- Open containers should be stored in a drying oven to prevent moisture pickup.
- Tumble contents prior to use to prevent segregation.

4.3 Safety Recommendations
See the SDS (Safety Data Sheet) in the version localized for the country where the material will be used. SDS are available from the Oerlikon web site at www.oerlikon.com/metco (Resources – Safety Data Sheets).
